

CurrenZYbot

(Z stands for Zabolotskiy and Y stands for Yagunov – our surnames - which is being one of the many features of this project)

Project Idea and Brief Description:

Members of our team are enthusiastic about cryptocurrency idea.

And we strongly believe that it has a bright future with lots of prospects and application areas. At this time, the area we are interested in the most is trading. Therefore, it is necessary for us to be in touch with the latest exchange rates and, by the way, we use Telegram messenger daily. That is how the idea of cryptocurrency Telegram bot appeared and we have agreed on it.

In our project we've made a bot that mainly uses some of capabilities JavaScript provides and data from Coinbase Exchange via its API to give user an actual currency information with the 15 minute interval of the three most popular crypto currencies: Bitcoin (BTC), Ethereum (ETH) and Litecoin (LTC).

Test cases:

Due to narrow functionality of our bot it's hard to provide functionality other than showing user BTC/ETH/LTC currency rate or picture/gif of cats
